

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A method comprising:
receiving ~~through a network an indication~~ indications from a device via a
network, each indication corresponding to a status;
upon determining from the indication that the device is in a first state in which a
first system has not been installed on the device, instructing the device
through the network to install the first system prior to installing a second
system, the second system including a first operating system;
upon receiving through the network from the device an indication that the first
system has been installed, indicating through a user interface that the
device is in a second state in which the device is available to install the
second system selectable through the user interface; and
upon a selection of the operating system, instructing the device through the
network to install the second system.
2. (Previously Presented) The method of claim 1, further comprising upon receiving
through the network from the device an indication that the second system has
been installed, indicating through the user interface that the device is in a state in
which the second system has been installed for the device.
3. (Previously Presented) The method of claim 2, further comprising upon receiving
through the network from the device the indication that the second system has
been installed, indicating through the user interface the second system that has
been installed for the device.
4. (Currently Amended) The method of claim 2, further comprising:

upon receiving the indication that the second system has been installed, indicating through the user interface that the device is in a third state in which the device is available for a third system to be selected for the device, the third system including a second operating system;

upon an indication to return the device to the third state in which the third system has not been selected for the device, instructing the device through the network to install the first system prior to installing the third system; and

upon receiving an indication through the network from the device that the first system has been installed, selecting the third system selectable through the user interface, and instructing the device ~~through~~through the network to install the third system.

Claims 5-7 (Cancelled)

8. (Currently Amended) A machine-readable medium having instructions which when executed, cause a machine to:
- receive ~~through a network an indication~~ indications from a device via a network,
each indication corresponding to a status;
- upon determining from the indication that the device is in a first state in which a first system has not been installed on the device, instruct the device through the network to install the first system prior to installing a second system, the second system including a first operating system;
- upon receiving through the network from the device an indication that the first system has been installed, indicate through a user interface that the device is in a second state in which the device is available to install the second system selectable through the user interface; and

upon a selection of the operating system, instruct the device through the network to install the second system.

9. (Previously Presented) The machine-readable medium of claim 8, wherein the instructions when further executed, cause the machine to upon receiving through the network from the device an indication that the second system has been installed, indicate through the user interface that the device is in a state in which the second system has been installed for the device.
10. (Previously Presented) The machine-readable medium of claim 9, wherein the instructions when further executed, cause the machine to upon receiving through the network from the device the indication that the second system has been installed, indicate through the user interface the second system that has been installed for the device.
11. (Currently Amended) The machine-readable medium of claim 9, wherein the instruction when further executed, cause the machine to:
upon receiving the indication that the second system has been installed, indicate through the user interface that the device is in a third state in which the is available for a third system has not been selected for the device, the third system including a second operating system;
upon an indication to return the device to the third state in which the third system has not been selected for the device, instruct the device through the network to install the first system prior to installing the third system; and
upon receiving an indication through the network from the device that the first system has been installed, select the third system selectable through the

user interface, and instruct the device ~~through~~ through the network to install the third system.

Claims 12-14 (Cancelled)

15. (Currently Amended)) A system comprising:

a network communication unit to receive ~~through a network a first indication~~ indications from a device via a network, each indication corresponding to a status, the network communication unit to upon receiving ~~the~~ a first indication, instruct the device through the network to install a first system upon a processing unit determining that the device is in a first state in which the first system has not been installed for the device, and receive through the network from the device a second indication that the first system has been installed; and the processing unit coupled with the network communication unit, the processing unit to determine from the first indication that the device is in the first state in which the first system has not been installed for the device, instruct the device through the network to install the first system prior to the second system, the second system including a first operating system, indicate through a user interface, upon the network communication unit receiving the second indication, that the device is in the second state in which the device is available to install a second system selectable through the user interface, and

upon the selection of the second system, instruct the device through the network to install the second system.

16. (Previously Presented) The system of claim 15, wherein the network communication unit is further to:
instruct the device through the network to install the second system upon the selection of the second system.

Claims 17-18 (Cancelled)

19. (Currently Amended) The ~~apparatus~~-system of claim 15, wherein the processing unit is further to indicate through the user interface, upon the network communication unit receiving a third indication, that the device is in a third state in which the device is available for a third system to be selected for the device, the third system including a second operating system.
20. (Currently Amended) The ~~apparatus~~-system of claim 19, wherein the network communication unit is further to:
instruct the device through the network to install the first system prior to installing the third system, and
instruct the device through the network to install the third system.

Claims 21-24 (Cancelled)
